Quick Intro to SLIs/SLOs/Error budget

Why do we need SLOs ?

- 1 A way to measure **reliability** from **user** point of view
- 2 A **common language** for all your teams
- 3 A way to fight **Alert-Fatigue**

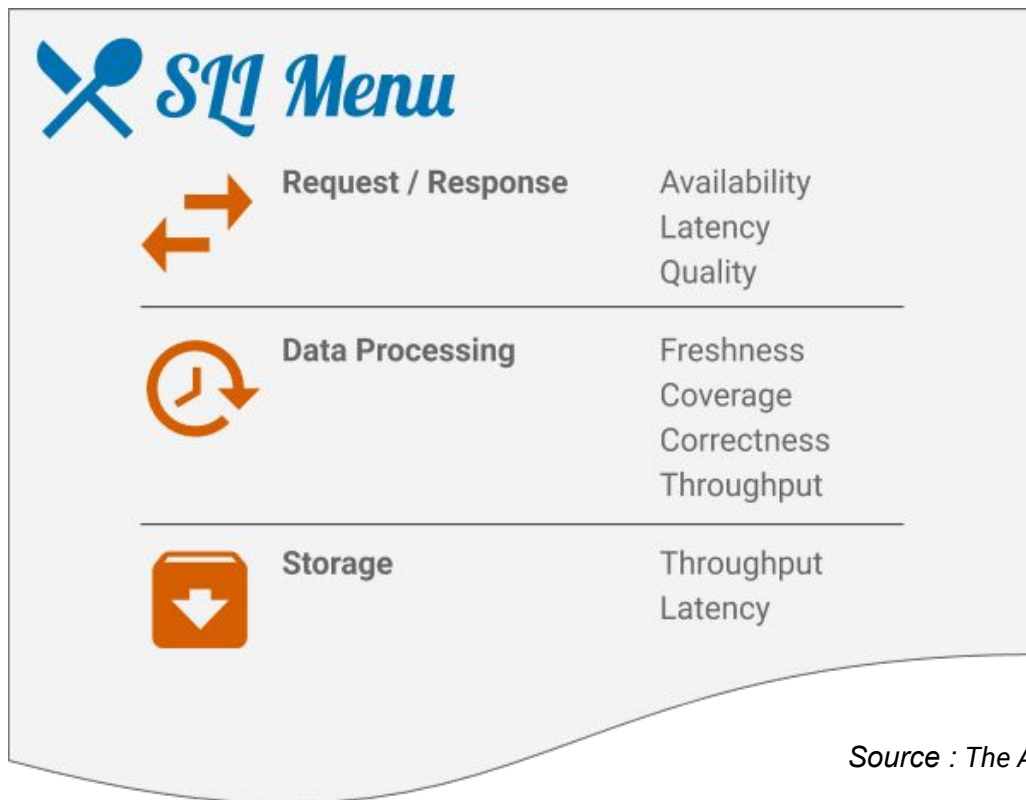

Service Level Indicator

- A **metric** that measure **one aspect** of a service's reliability
- meaningful for the service consumer
- computed in an automated way

Source : *The Art of SLOs – Slides (Google)*

Types of SLIs

Source : The Art of SLOs – Slides (Google)

Service Level Objectives

- A **target** for one SLI
- Over a **measurement window**
- It represents the consumer expectations

SLI, SLO and Error Budget

My workload is **Up** or **Down** ?

Objective set to **99.9%** up over **30 days**.

Allowed downtime is **43 min**
(0,1% of 30 days)

Why it can go wrong ?

Releasing
new (buggy)
features

Inevitable
Failures
(hardware, network,
providers)

Risky
experiments

Our Implementation of HTTP SLOs

Deployment Plan

1

Base

Deploy technical SLOs on HTTP endpoints

2

Combine

Deploy feature SLOs

3

Policy

Ensure SLO reviews are in place

HTTP SLOs

On **every** HTTP endpoints

- SLI
 - **Datadog Monitor** on Latency / Availability (/ Quality)
- Monitor based **Datadog SLO**
 - 2 windows: 7d / 30d
- Burn Rate Alerts
 - Datadog Monitors on **Error Budget** Consumption

We've redesigned this page to highlight your primary time window and target. If you need to access the legacy version, click here.

The overall SLO status is calculated as the uptime percentage across all monitors or monitor groups, unless specific groups have been selected. If no specific groups are selected, the UI displays the five groups with the worst statuses. See our [documentation](#) for more details.

Deployment: Terraform Module

Benefits of a Terraform Module

- Ease adoption: Automate the creation
- Standardization
 - Name Convention
 - Metrics: APM / Istio
 - Profiles: Objective/Error Budget
- Easy to rollout changes and update

Name	timeframe	SLO target	Error budget
platinum	30d	99.95	0 day(s) 0h21m55s

      }
    ]
  }
  tags = ["service:inventory", "env:prod"]
}
```

Next Step: Display SLOs from a product point of view

- How to make it meaningful for non tech teams ?
- Gather availability per feature (like : signup, booking, search...)
- List all endpoints per feature, then build a combined SLO from these endpoints.

Feature SLOs

Feature SLO : How to compute target ?

The feature availability SLO is simply calculated by multiplying the availability of the two systems

Example of the Search Feature

Last step : SLO Reviews

From the publication, regularly review technical SLO

Tech Team

Product Team

If necessary adjusts thresholds/targets

Prioritize reliability topics in the sprints/roadmap

Key results

Feature SLO : Summary

Teams are looking for this high level observability

Better visibility of SLOs through the company

Better Product & Tech prioritisation

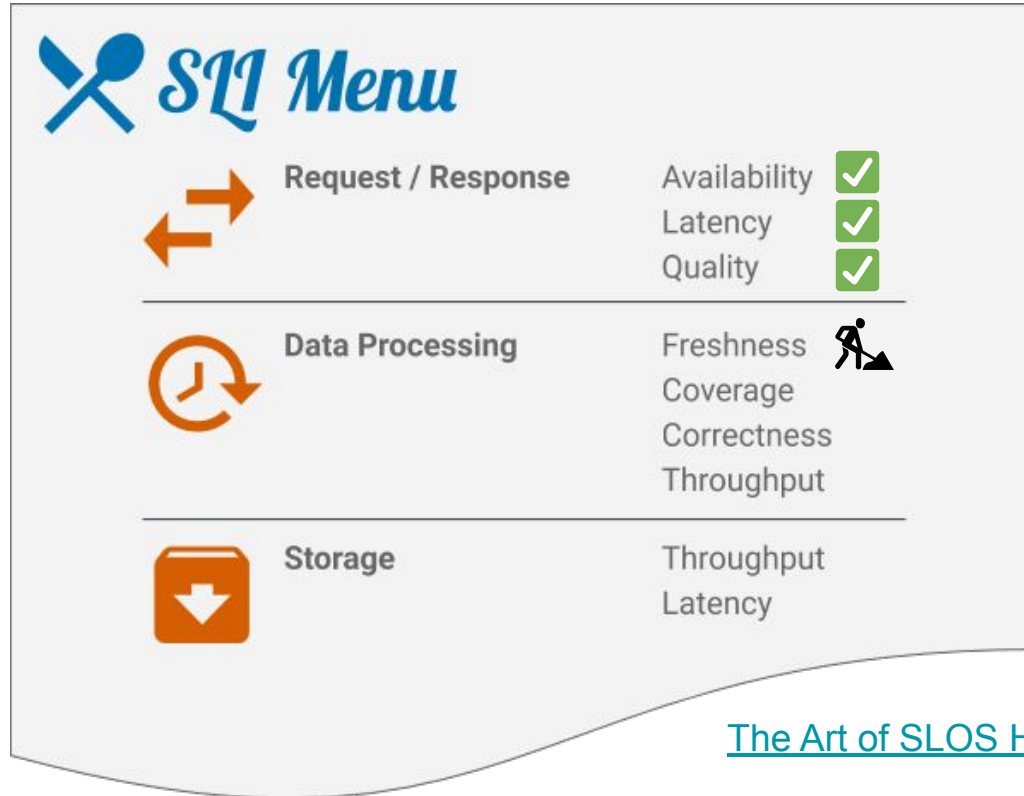

Numbers of Alerts is decreasing

Next steps and takeaways

Next steps: add other SLO types

Next steps: continue to onboard teams

SLO Policy

SLO Reviews

Takeaways

Start simple

Onboard teams
